

# Verification

## Establish a global trust anchor

Delivers phone-based verification and two-factor authentication using a one-time passcode sent over SMS or voice message.

Ensuring the validity of your users is extremely important in preventing fraud and securing accounts from compromise. A great way to do that is to attach a verified phone number to end-user accounts, ideally when they first register. From there, that user's identity can easily be confirmed when they access their account from a new browser or device or attempt a high-value transaction.

### High quality, direct-to-carrier routes

Connects directly to thousands of carriers around the world and employs a waterfall approach across multiple routes to help ensure the highest delivery and conversion rates.

### Secure, time-based, one-time passcode (TOTP)

Verifies users in real time by sending a one-time code via SMS that can be used to authenticate a known user, verify a transaction or block fraudsters from opening illegitimate accounts against carrier subscriber contact data.

### Reliable global coverage

Reach and ensure message delivery to end-users in over 200 countries and territories and in 87 different languages.

### Answering machine OTP delivery prevention

Prevents voice-based passcode messages from being sent to an answering machine by requiring that end-users press a key to hear the voice message, thereby reducing the risk of the code being accessed or stolen from the answering machine by hackers.

### Long message support

Separates SMS message over 160 characters based on device type and operator requirements and sends it to the user's handset with instructions to reassemble the message back in the correct order as one SMS.

### Smart message splitting

When splitting a long SMS message, it prevents the breaking of critical pieces of information, such as urls and email addresses, to ensure messages are delivered and viewed as intended.

### Advanced phone number cleansing

Properly formats phone number entered by end-user to ensure greater global delivery.

### Dynamic callerID

Send phone calls from dedicated virtual numbers/callerIDs to ensure numbers are recognizable to end users. (Access Telesign's verified, high-quality virtual numbers/CallerIDs).

### Traffic monitoring

Automated traffic monitoring for red flags and suspicious patterns, which helps protect businesses from International Revenue Share Fraud (IRSF) attacks.

# Benefits

## Prevent fake users

Mitigate new account registration fraud and attempts at bulk account creation.

## Protect account access

Seamlessly authenticate existing users and secure accounts from compromise.

## Verify transactions

Verify high-value transactions such as accessing credit card details, transferring funds or making bill payments.

## Access 24x7 support

Team up with a dedicated technical account manager who provides user experience reviews and ensures global integrations are successfully implemented.

# How it works

The following is one example of how to use the product to verify the identity of a user attempting to access their Web account from a new device.

1. The user visits your website and enters their existing credentials (username and password) to access their account.
2. The user already provided a verified mobile phone number when they first registered for an account.
3. Because this is the first time the user is accessing their account from a new device, a challenge is needed to further verify the user and permit them to complete the login attempt.
4. Verification sends a one-time passcode by SMS or Voice message to the user's mobile number and at the same time, the user is shown a secondary login screen in their Web browser with a prompt to enter the passcode once it is received.
5. Once the user receives the passcode to their mobile device, they simply enter it in on the webpage as prompted.
6. You confirm with Telesign that the passcode entered is the same code that was sent to the user and, if matched, the user is verified.
7. The user is then able to access their account.

"We needed a partner that could scale to support our ever expanding global footprint. Telesign delivered the scale we were looking for."

Chuck Mortimore  
VP, Product Management, Salesforce

Telesign provides continuous trust to leading global enterprises by connecting, protecting and defending their digital identities. Telesign verifies over five billion unique phone numbers a month, representing half of the world's mobile users, and provides critical insight into the remaining billions. The company's powerful AI and extensive data science deliver identity with a unique combination of speed, accuracy and global reach. Telesign solutions prevent fraud, secure communications and enable the digital economy by allowing companies and customers to engage with confidence.
